# Between the “*whoop*” and the “*ding*” ...

## Binary neutron star merger

Fermi

→ **GRB**  
*ding!*

LIGO

→ **GWs**  
*whoop!*

When is the GRB launched?

# ... a hypermassive neutron star?

HMNS lives for  $< 1$  s, spins fast, jiggles and emits kHz GWs too high for current GW detectors!

**From simulations:**

**heavier** 20% more mass than the heaviest known pulsar: J0740+6620

**bigger** 2 times the size of a typical NS

An HMNS can be heavier than a normal NS **because** of its fast spin!

# Differential rotation

NASA

Wikipedia

HMNS

Kastaun, Ciolfi & Giacomazzo, 2018

Periodic signal  
single frequency

**astrophysical example:** pulsars

Periodic signal  
single frequency

**astrophysical example:** pulsars

Quasi-periodic signal  
*not* a single frequency

**causes of quasi-periodicity:**  
many close frequencies,  
dissipation or time variation

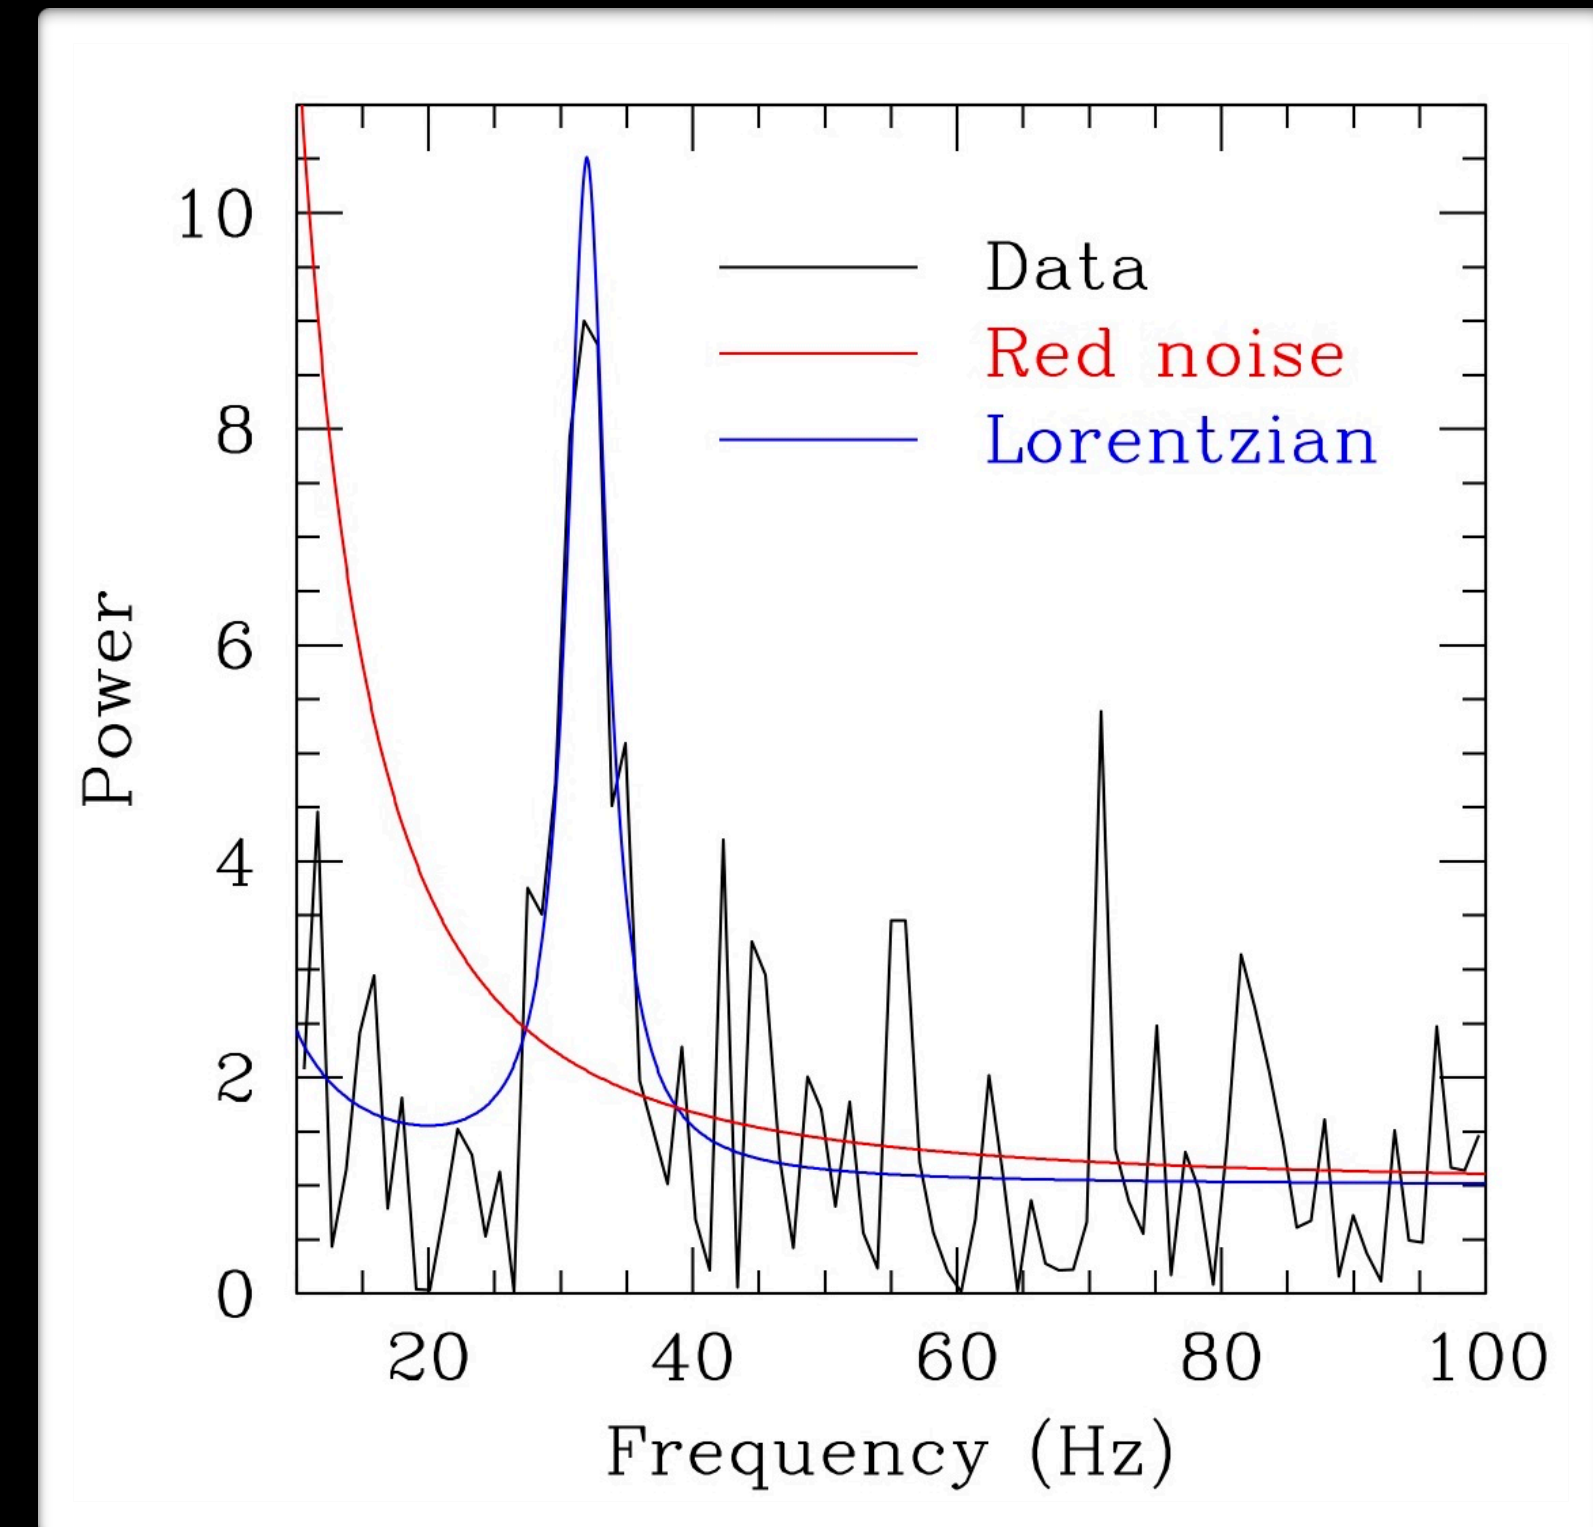

# Examples of quasi-periodic oscillations

black hole X-ray binary XTE J1550-564

Motta et al. 2018

X-ray tail of SGR 1806-20 giant flare

Miller, Chirenti & Strohmayer 2019

# HMNS Quasi-periodic oscillations

HMNS signal:

short-lived  
time-evolving  
dissipative\*

quasi-periodic oscillations  
(QPOs)

Takami, Rezzolla & Baiotti, 2014

Could the  
GRB show  
these QPOs?

\*simulations also have numerical dissipation!

# GRB QPOs?

How does the HMNS oscillate?

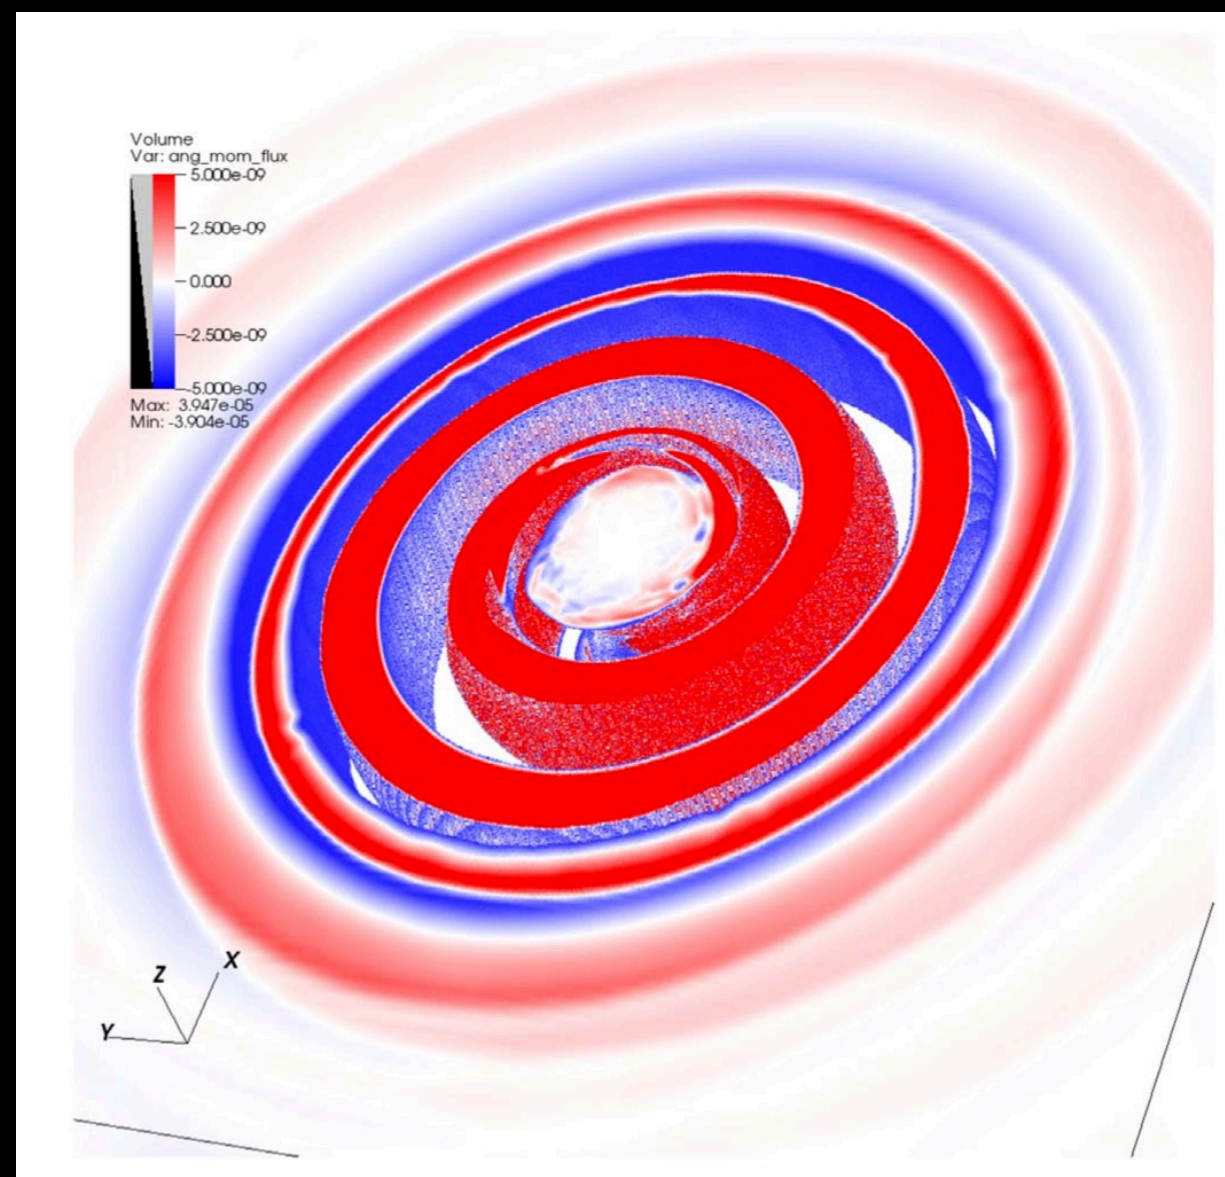

Takami, Rezzolla & Baiotti, 2015

How (and when) could the oscillations transmitted to the GRB?

Stergioulas et al. 2011

Nedora et al. 2019

adapted from Lorimer & Kramer, 2004

# What we are looking for:

Oscillations that

- \*last for approx 100 ms (lifetime of an HMNS)
- \*have frequencies in the range 500 – 5,000 Hz

$$n_{\sigma} = \frac{1}{2} I a_{\text{osc}} \sqrt{\frac{\Delta t}{\Delta f}}$$

## How: Bayesian model comparison

**Model 0:** White noise only

**Model 1:** White noise + QPO

We analyze each burst divided into short segments and quote the Bayes factor in favor of the noise + QPO model for each segment

# Initial analyses: Lessons learned

## Causes of fake QPOs

Cosmic rays

Detector artifacts\*

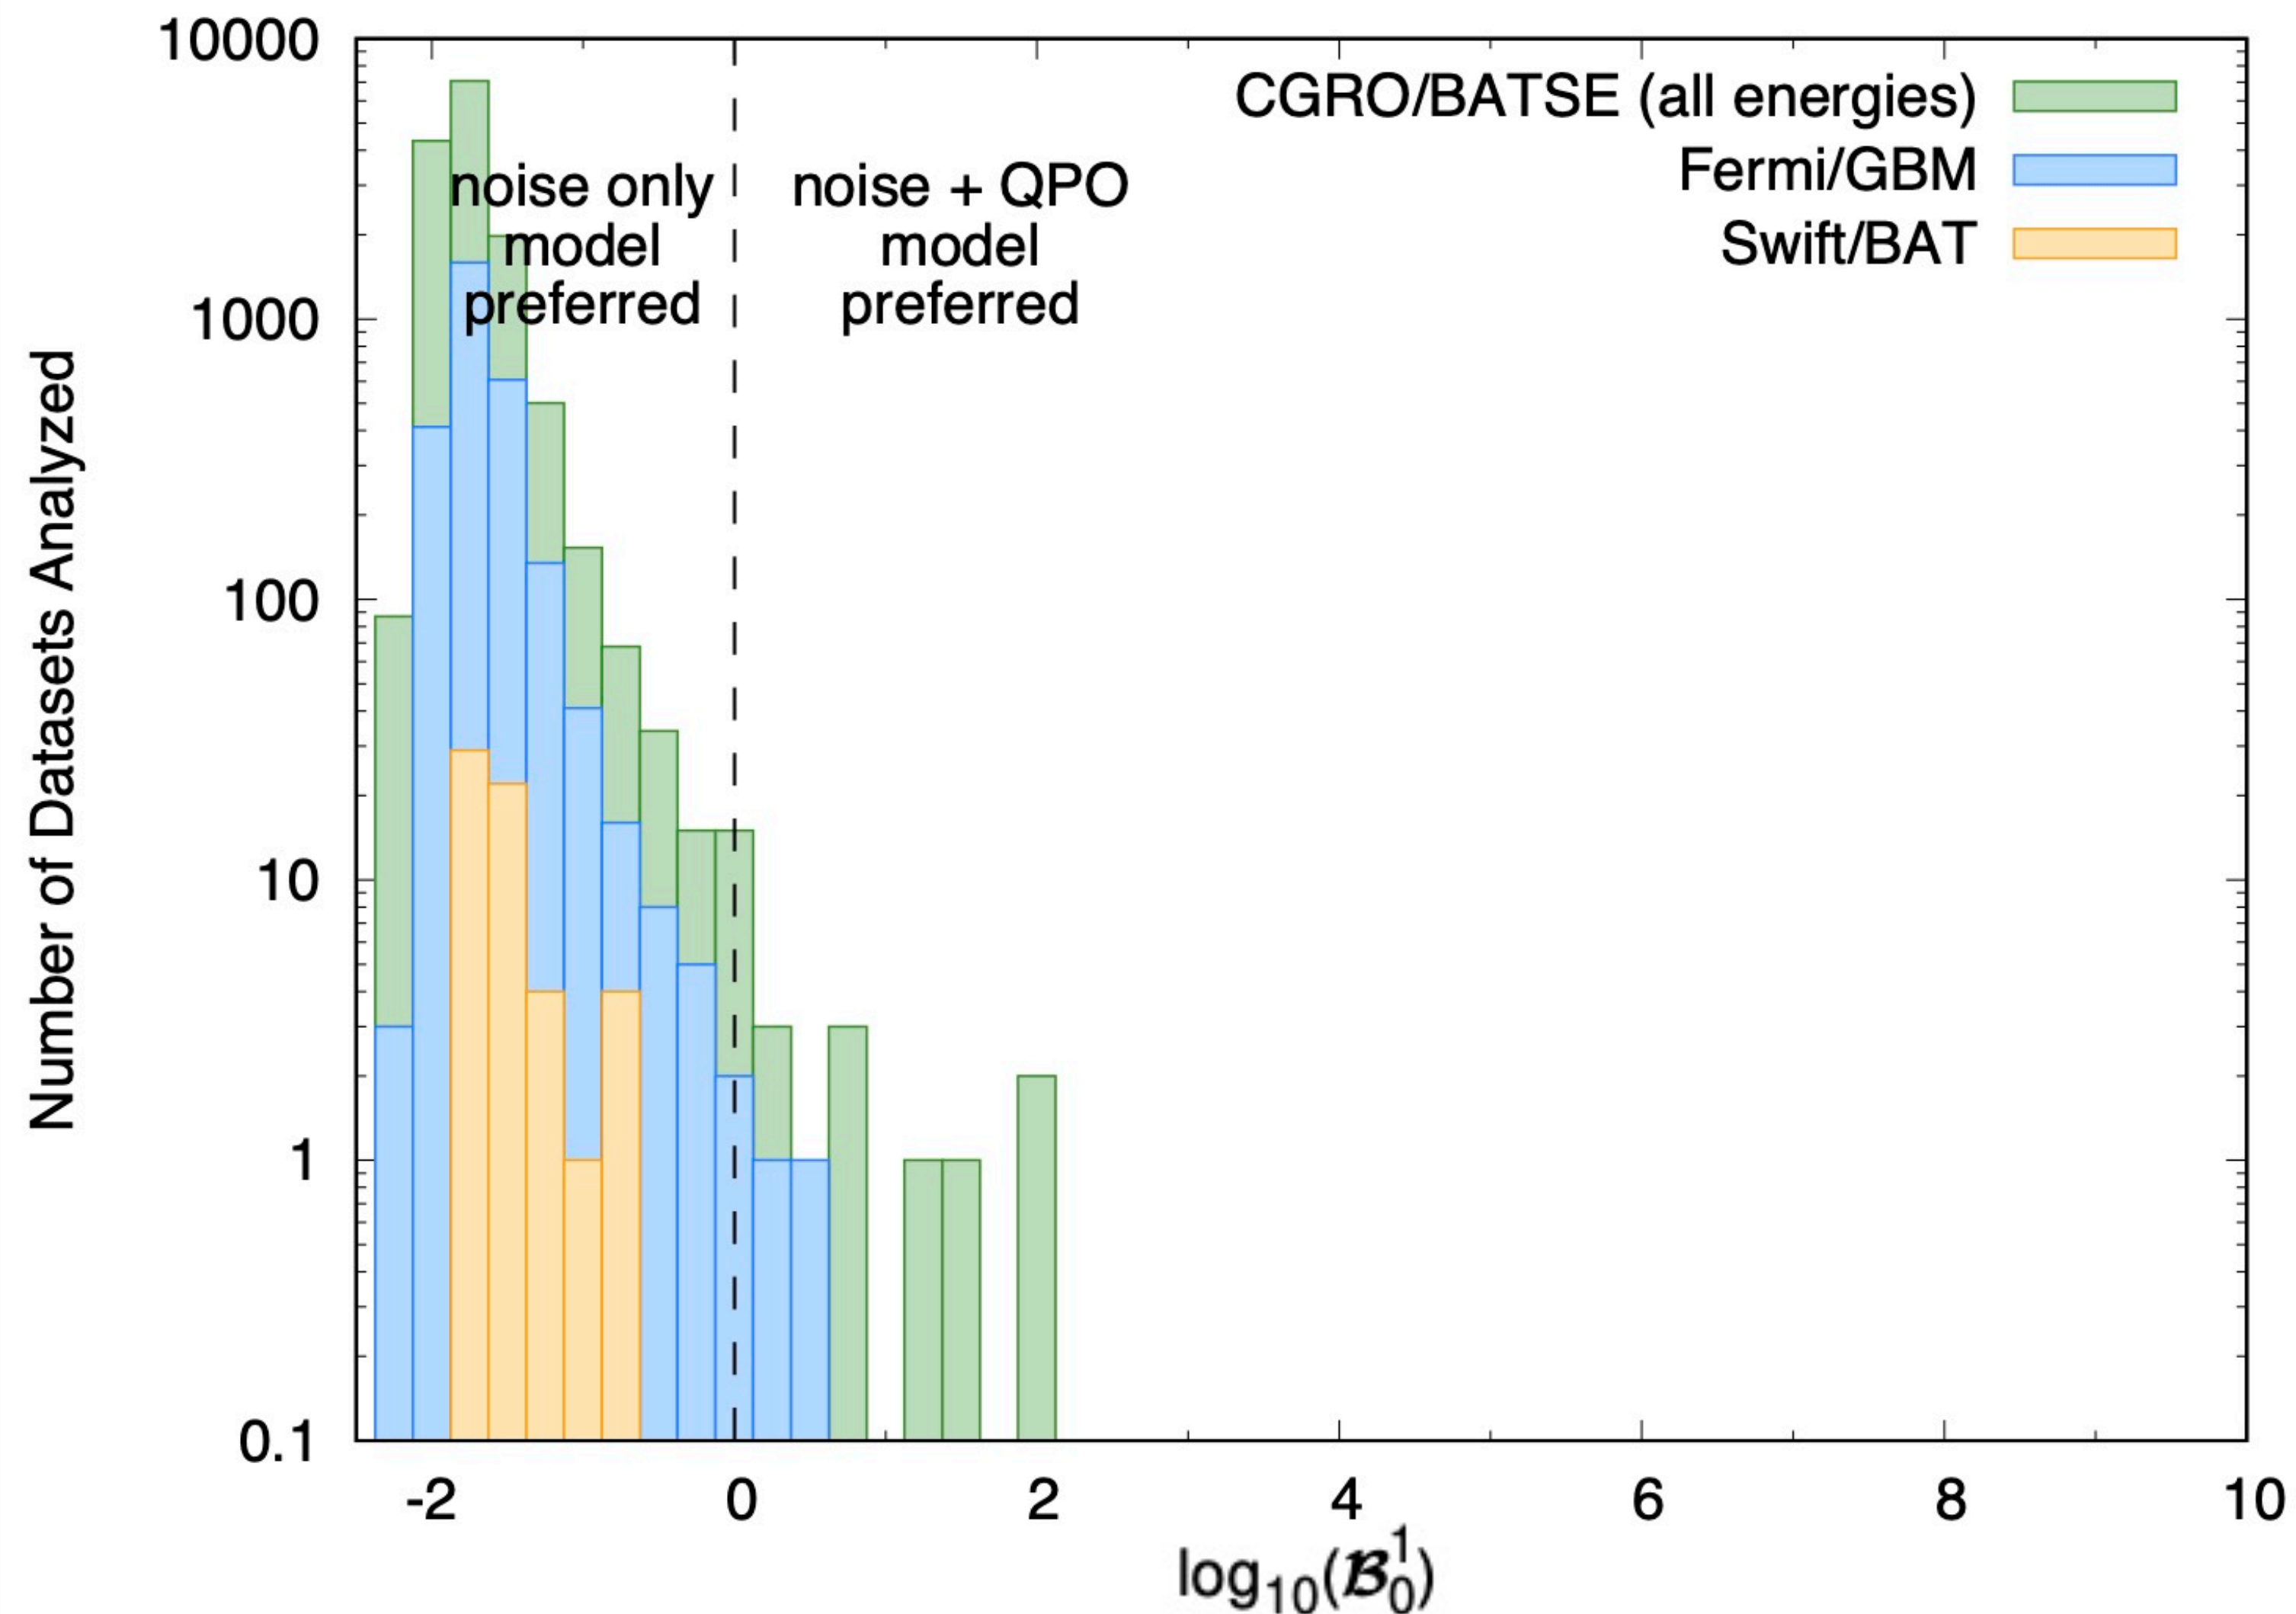

(Data corruption)

Red noise contamination

# Opening the treasure trove

More than 700 short GRBs analyzed

Each GRB split in smaller segments for analysis

Nothing pops up in Fermi or Swift data

Something in the BATSE data?  
Let's look more closely.

# CGRO transforms GRB science

NASA's Compton Gamma Ray Observatory

Launched in 1991  
De-orbited in 2000

## Compton Gamma-Ray Observatory

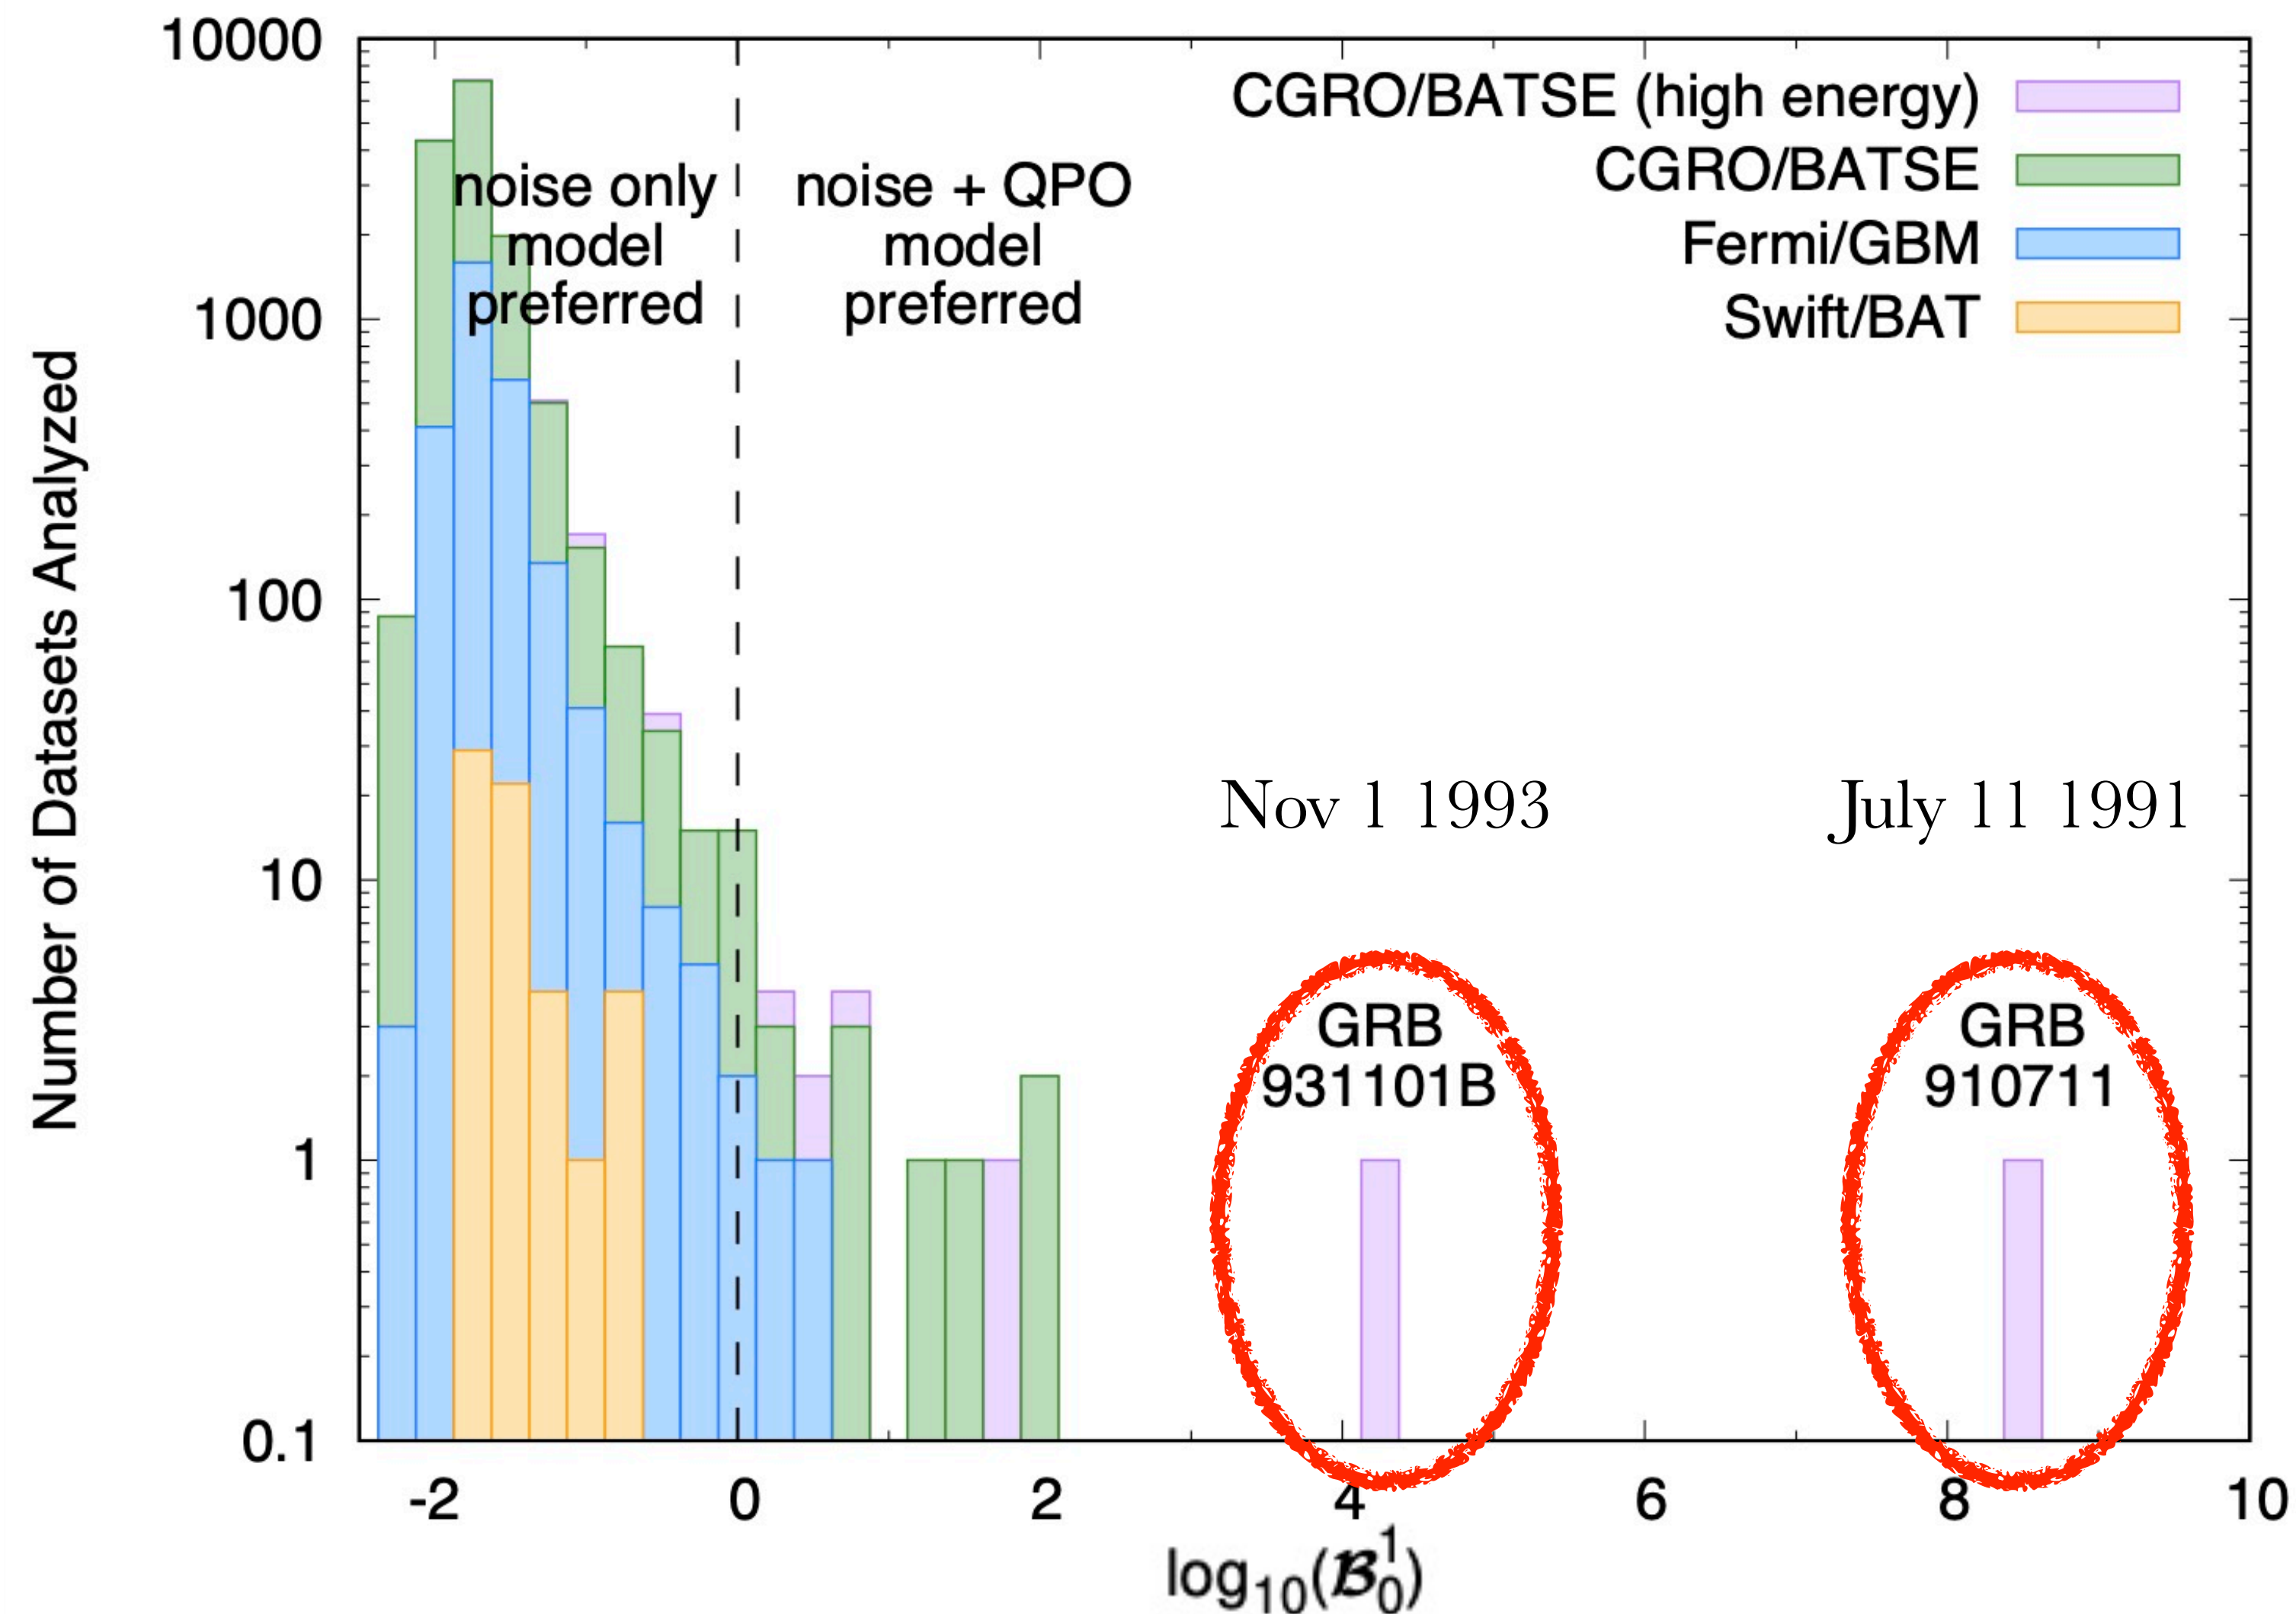

was one of NASA's  
Great Observatories

### 2704 BATSE Gamma-Ray Bursts

# Opening the treasure trove

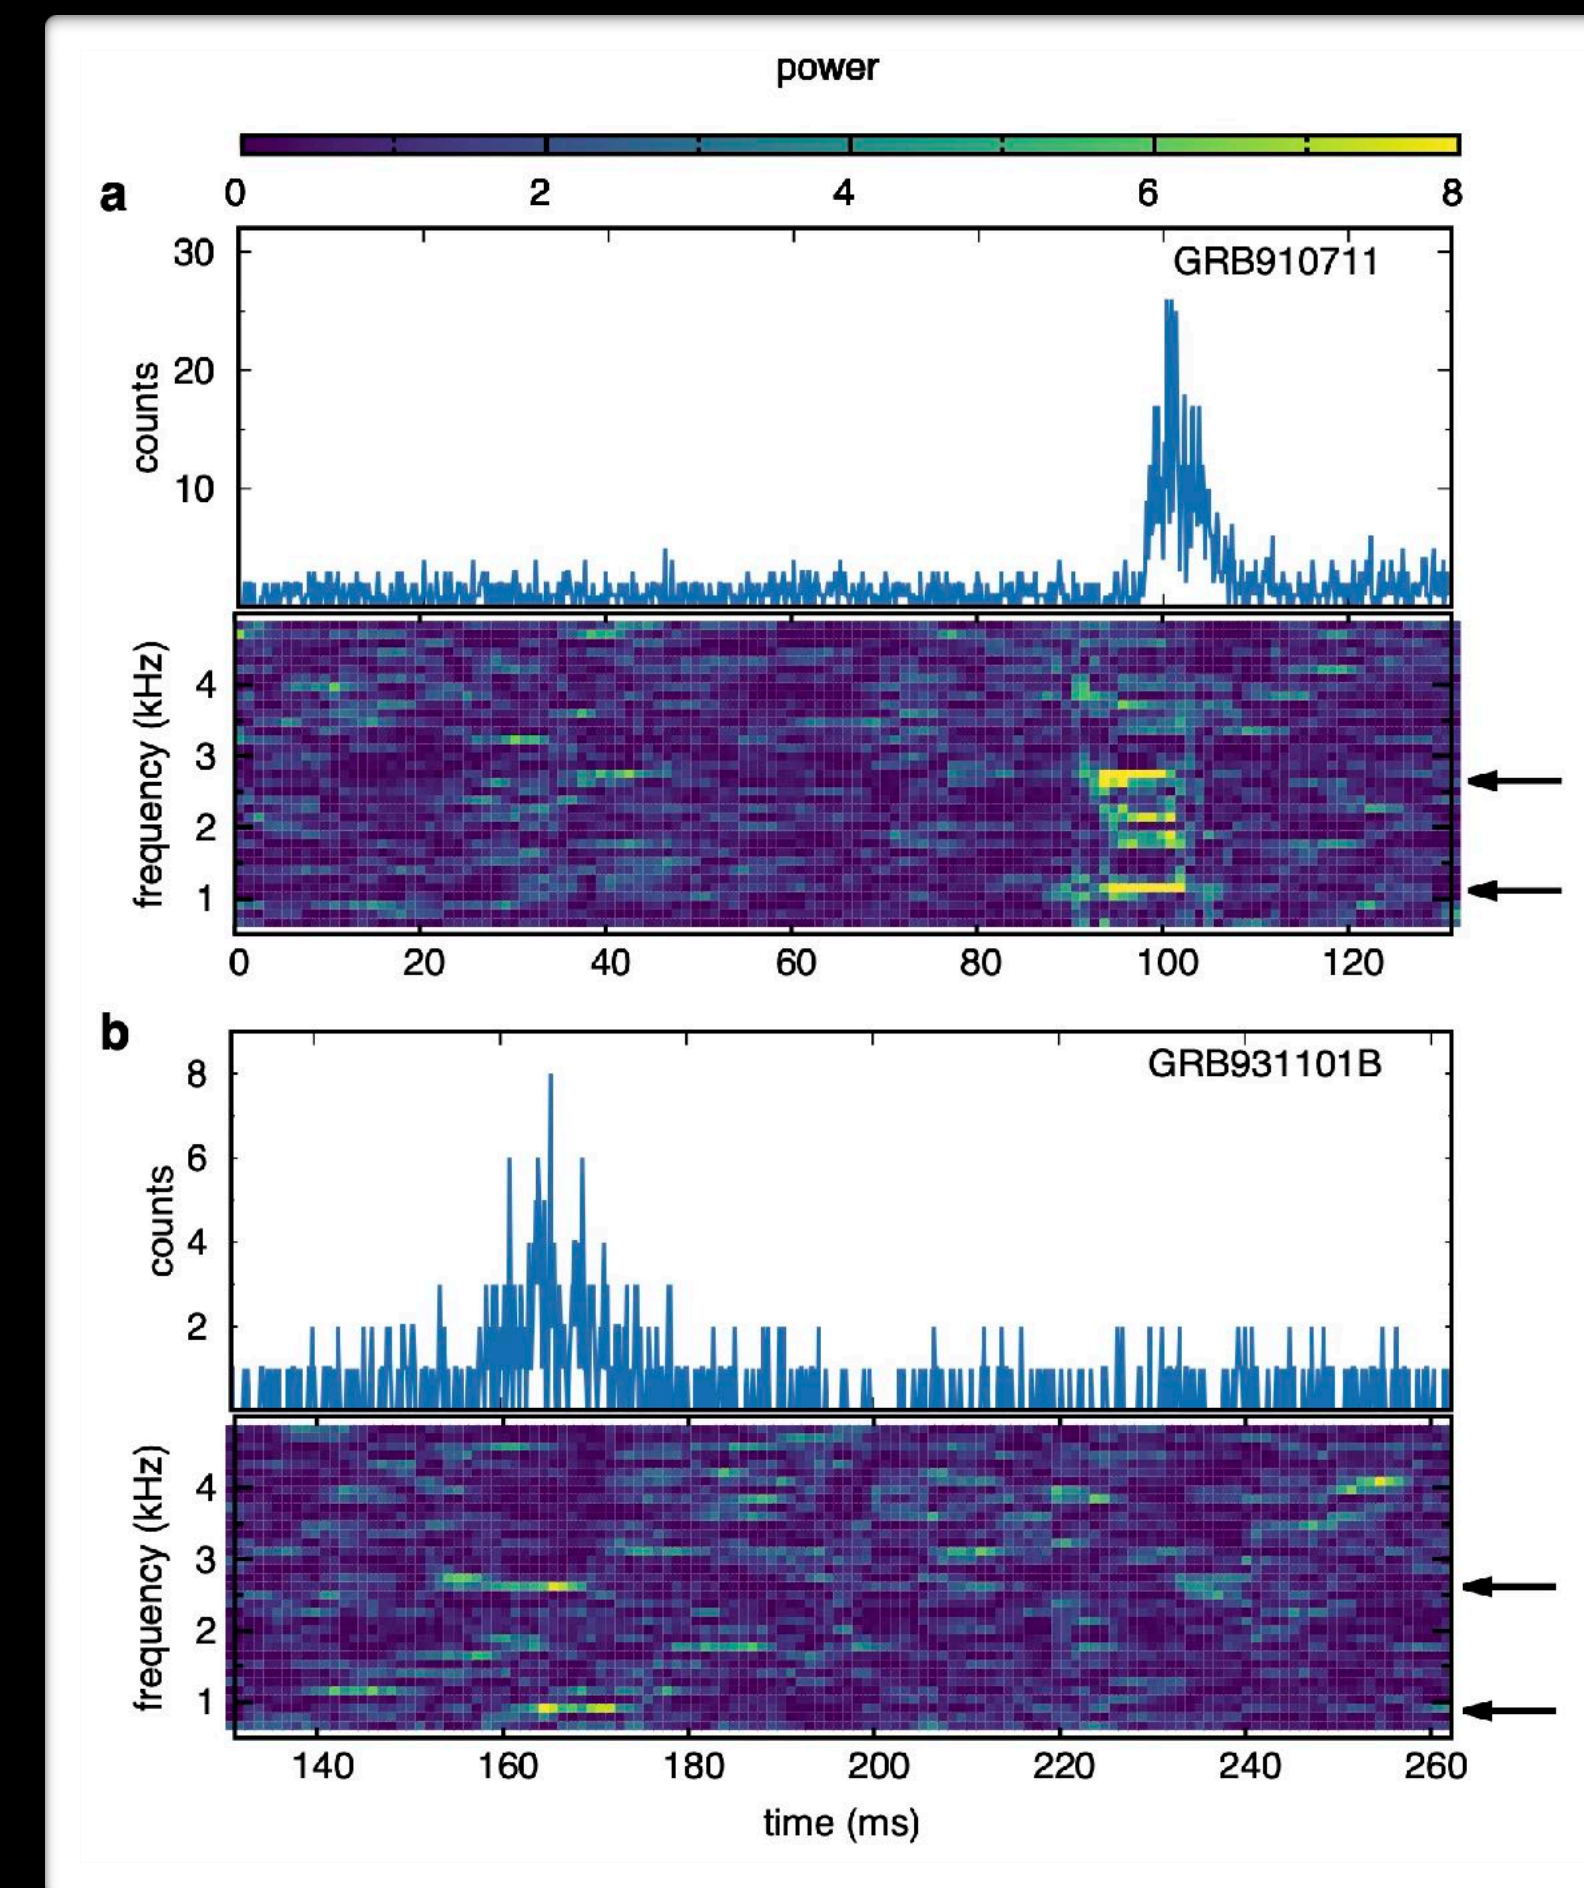

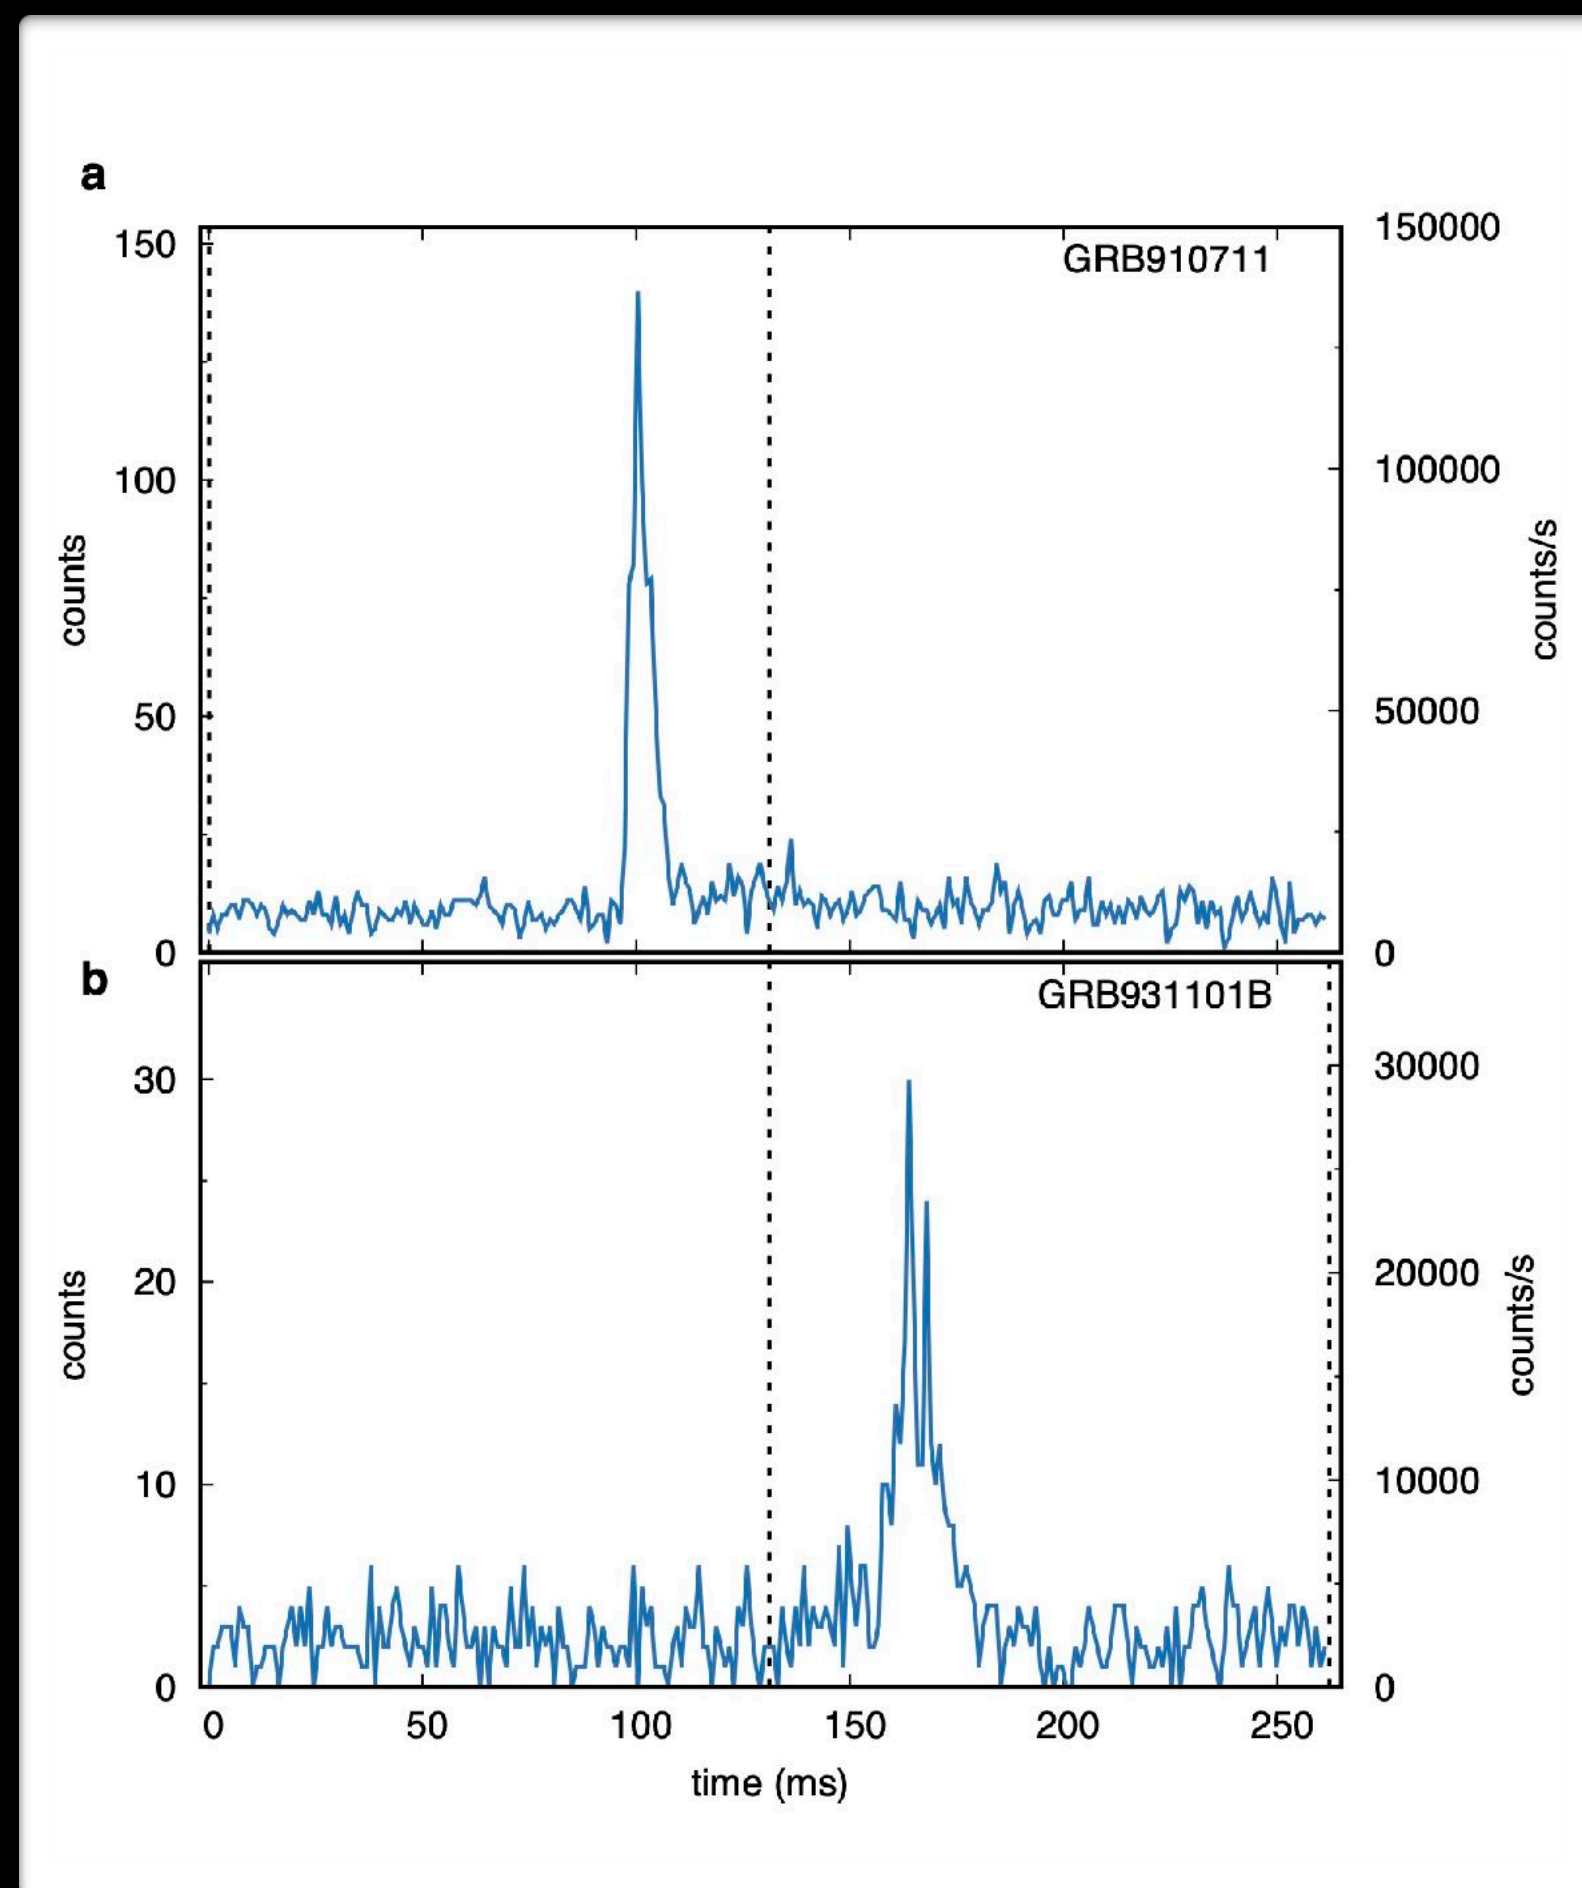

... and **bang!** Two signals.  
The combined false positive rate is  
1 in 3.3 million!

Both signals have:  
2 QPOs each  
with similar frequencies  
and good agreement with  
simulations

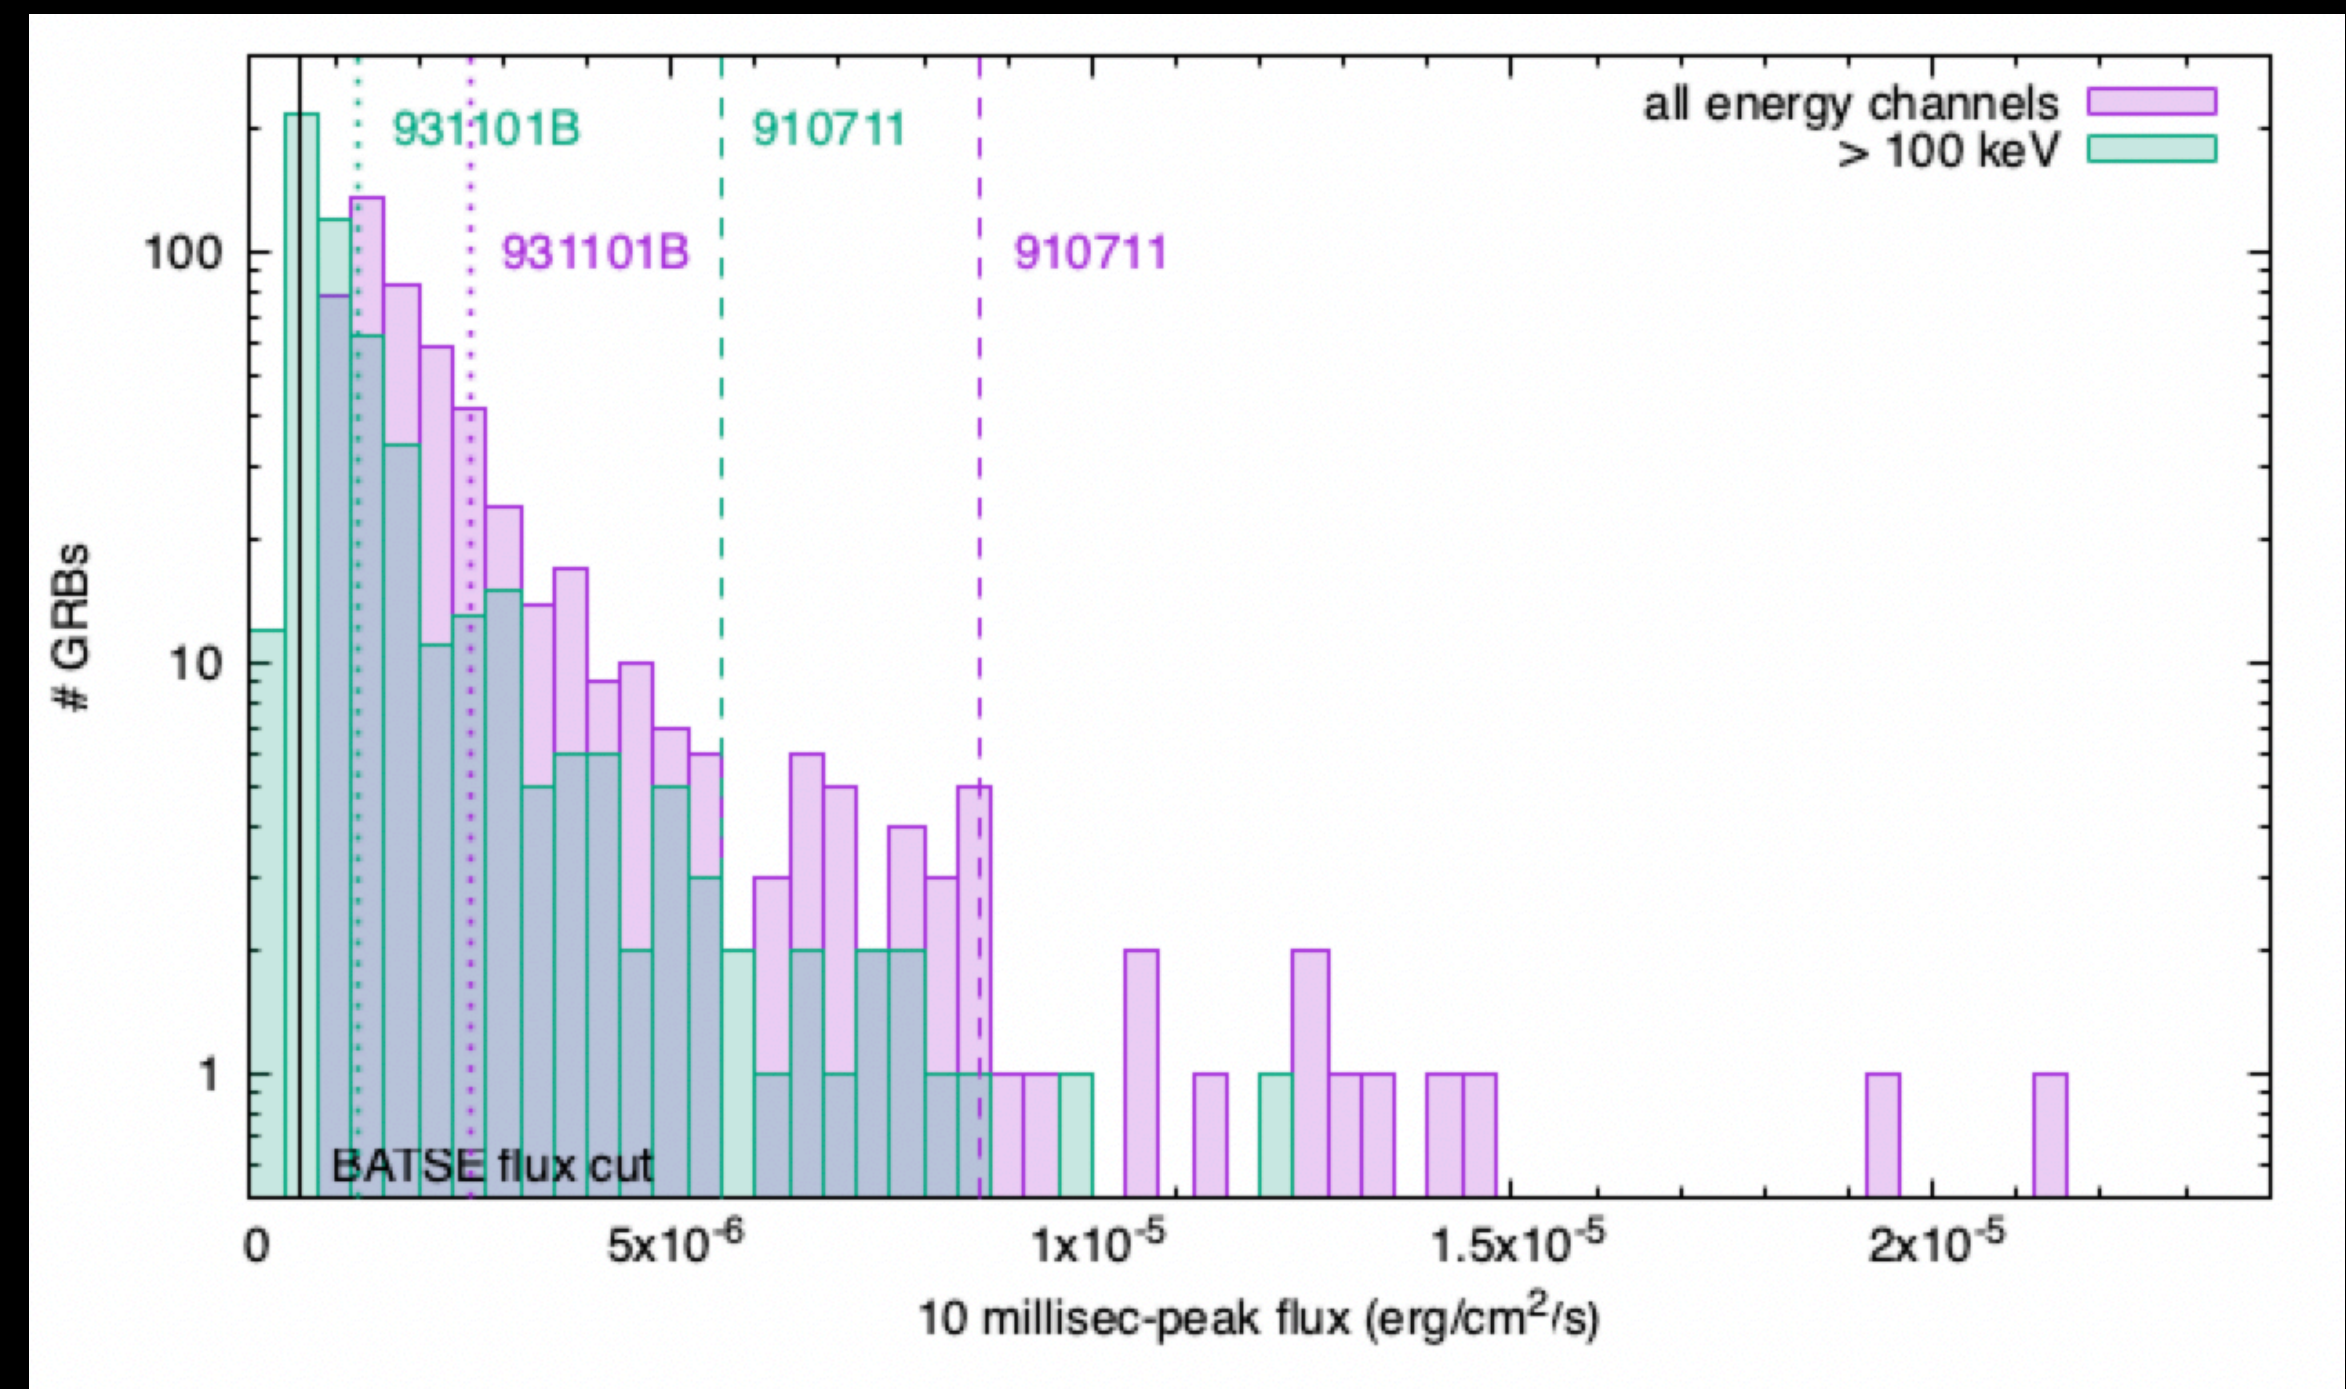

# Light curves and power spectra

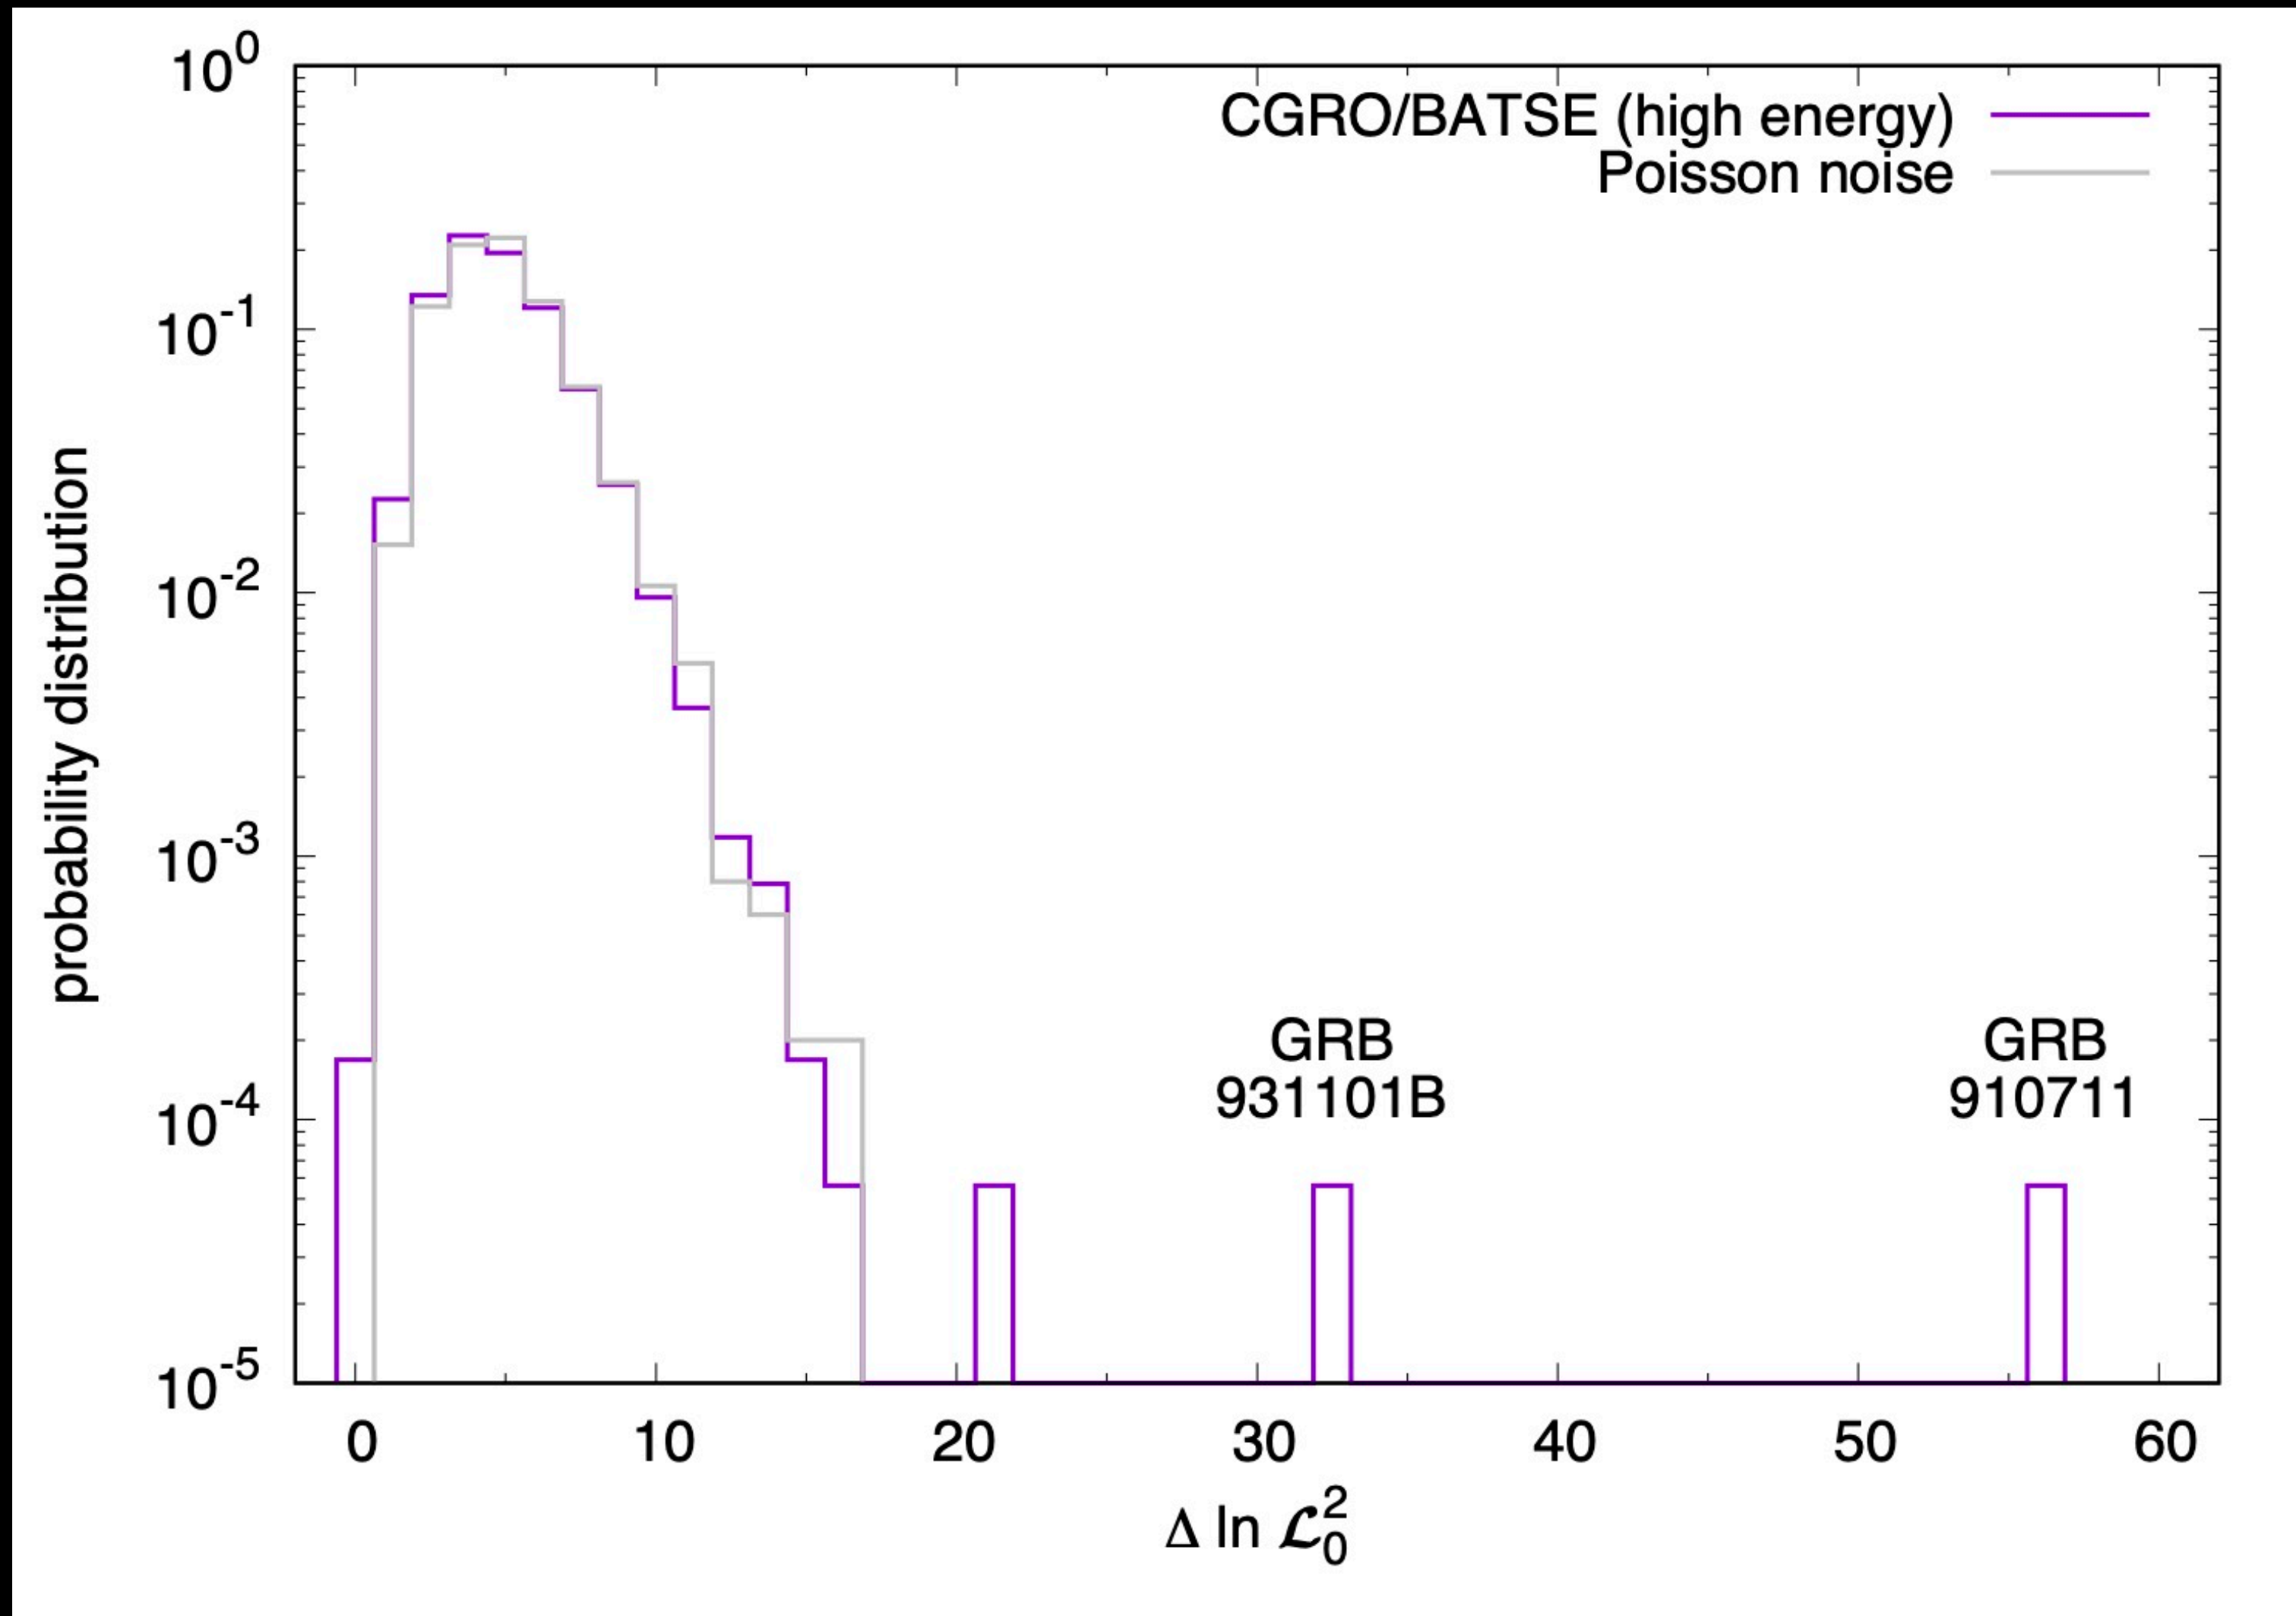

# BATSE GRB distribution

How special are these bursts?

# False positive estimate I

# False positive estimate II

# False positive estimate III

GRB	Trigger #	$T_{90}$ (ms)	Counts	Prob( $\Delta \ln \mathcal{L}_0^2 > 56.4$ )	Prob( $\Delta \ln \mathcal{L}_0^2 > 33.3$ )
<b>910711</b>	512	14	1790	$5.9 \times 10^{-5}$	$9.2 \times 10^{-3}$
910508	207	30	1254	$2.2 \times 10^{-6}$	$1.6 \times 10^{-3}$
<b>931101B</b>	2615	34	524	$2.6 \times 10^{-6}$	$1.3 \times 10^{-3}$
910625	432	50	1810	$7.2 \times 10^{-7}$	$9.3 \times 10^{-4}$
910703	480	62	2278	$1.8 \times 10^{-7}$	$7.5 \times 10^{-4}$
940621C	3037	66	710	$2.0 \times 10^{-10}$	$7.9 \times 10^{-6}$
930113C	2132	90	612	$4.1 \times 10^{-11}$	$2.9 \times 10^{-6}$

The combined false positive probability is  $\sim 3 \times 10^{-7}$

# A record-breaking neutron star

These signals are consistent with an HMNS:

**QPO 1** High frequency!  
~ 1 kHz  
lower amplitude

**QPO 2** Higher frequency!  
~ 2.6 kHz, higher amplitude  
info on NS composition

Compared with other NSs, the HMNS is:

**faster** 1.3 kHz, almost 2 times  
the spin of the fastest known  
pulsar: J1748–2446ad

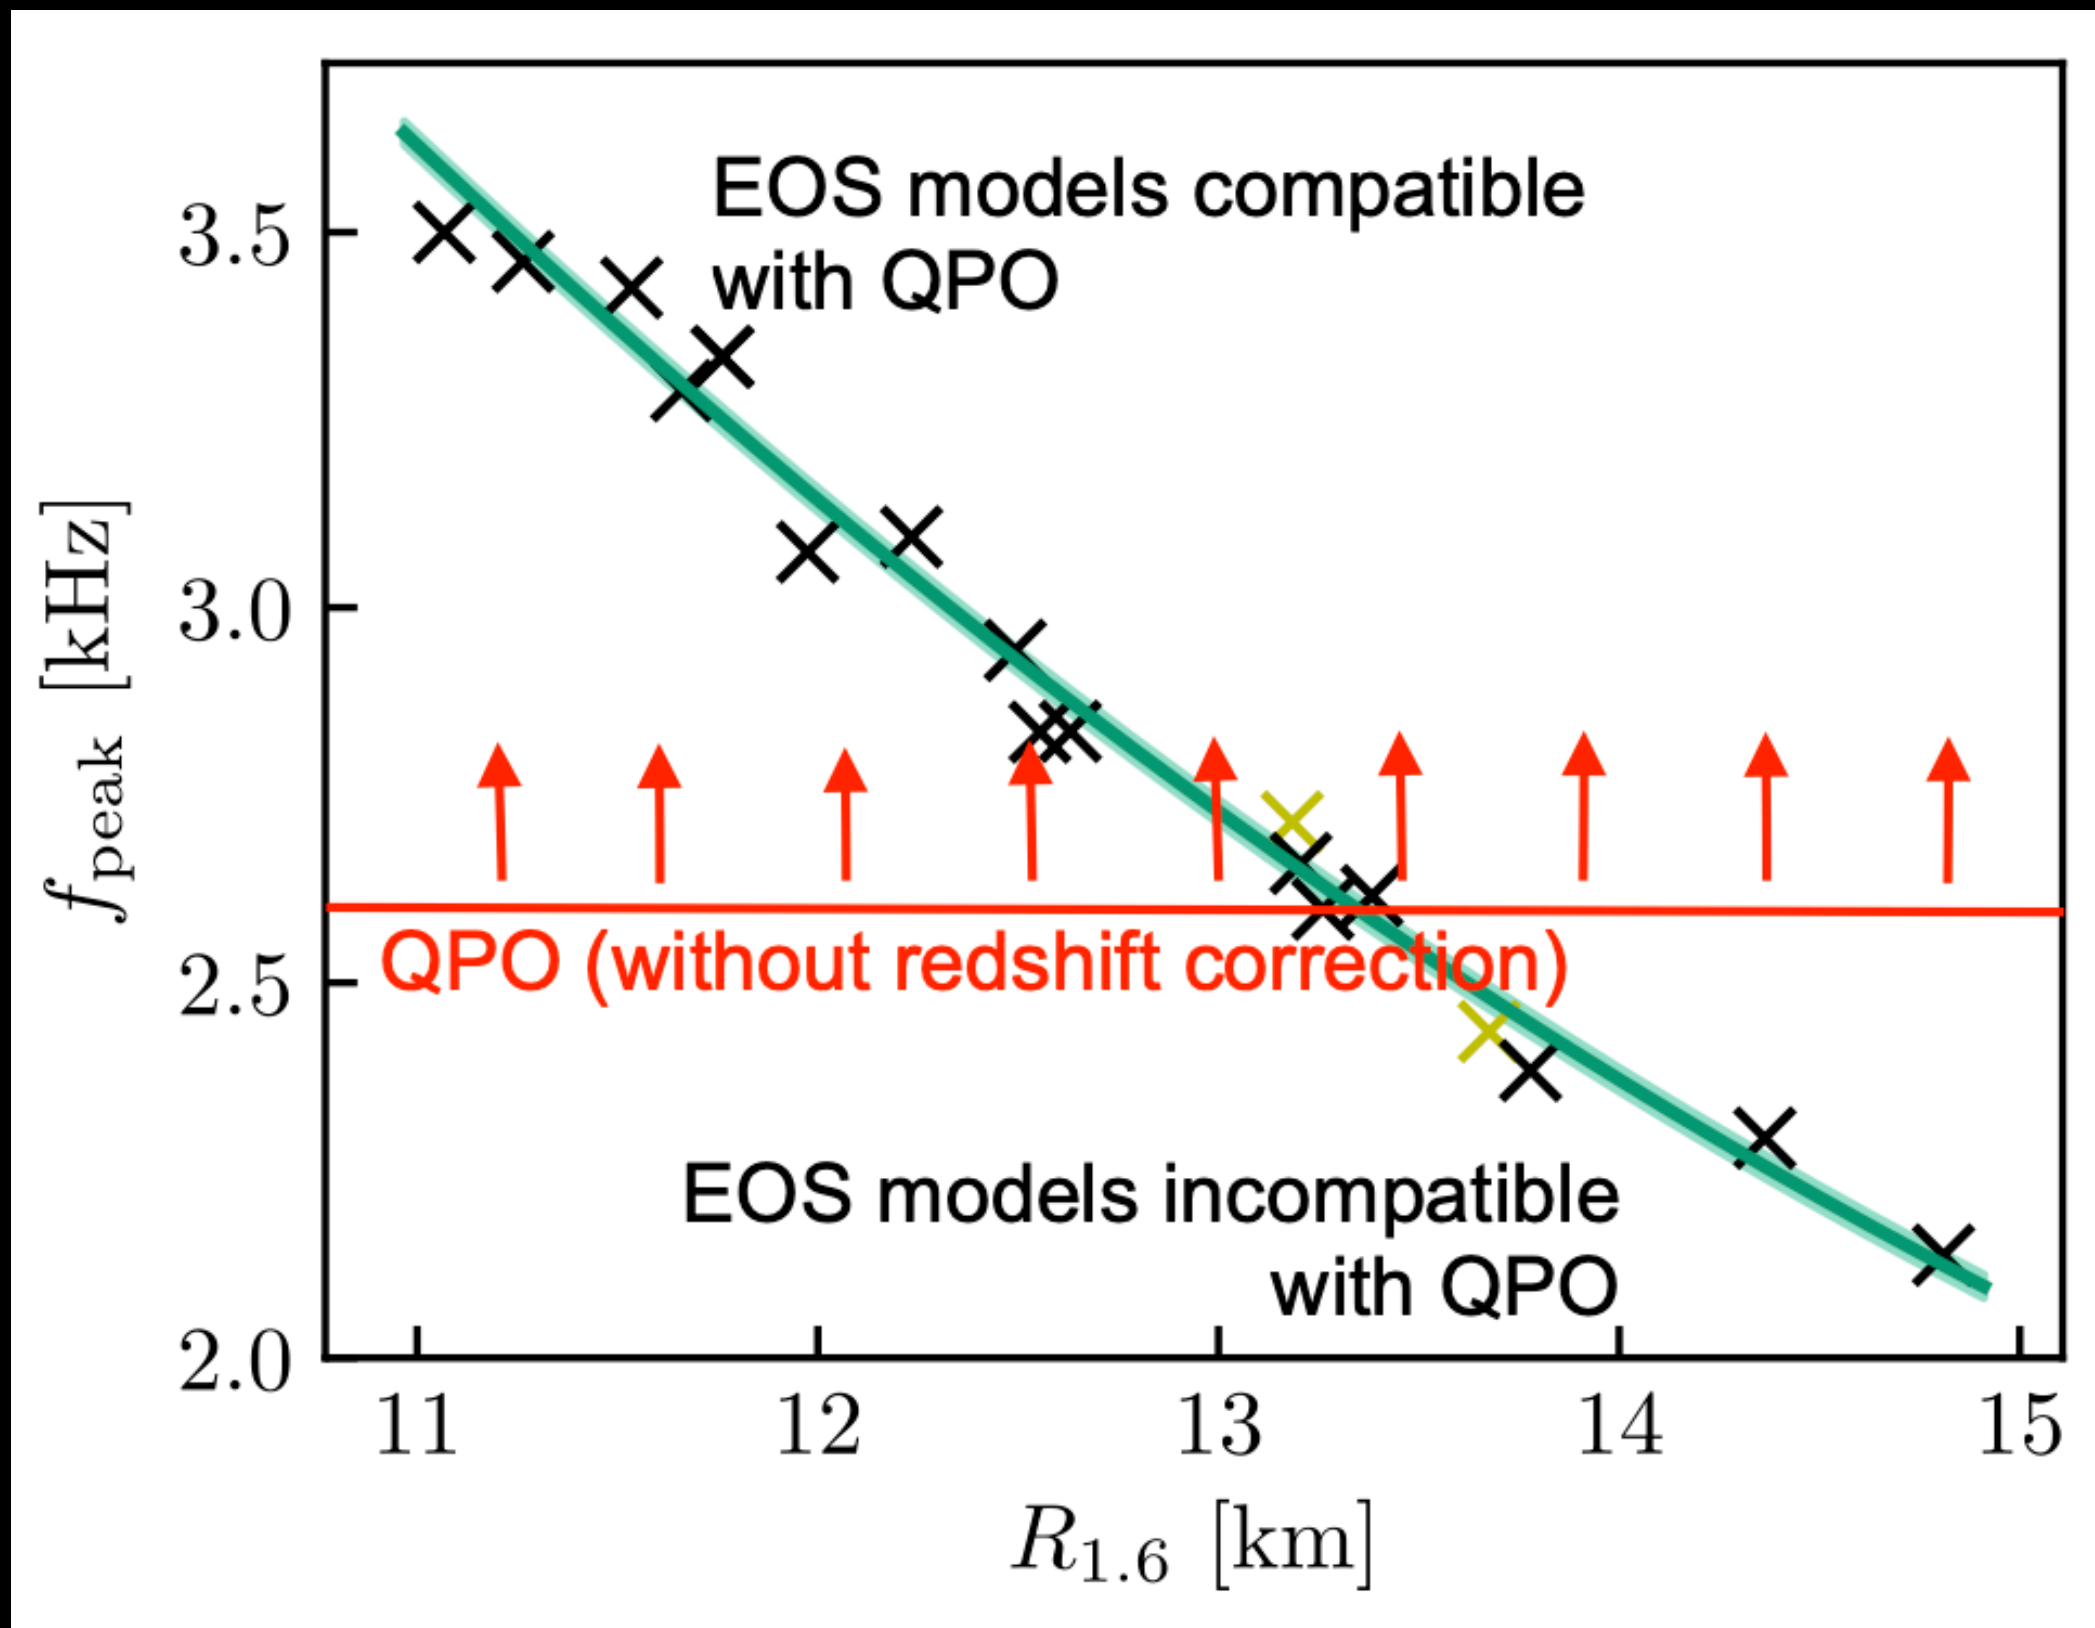

**forms a black hole** 10 times  
faster than the blink of an eye:  
signals last for only 10 millisecs

# Learning about the neutron star equation of state

## QPOs + NR

adapted from Lioutas et al., 2021

## NICER + GWs + GRB

adapted from Reddy, 2021

# From gamma rays to radio?

Where do we look?

R.A.:  $209.9^\circ$

Dec:  $-16.4^\circ$

Error:  $9.3^\circ$

(for GRB 910711)

“Challenge accepted!”  
- radioastronomer

# Past and Future

“Why BATSE”?

Future missions:

	BATSE	BAT	GBM	AMEGO-X	COSI
Effective area (cm <sup>2</sup> )	2,000	1,400	240	1,200	256 (physical area)
Timing (microsec)	2	100	2	10	3

Simulated  
Gravitational  
Waves

Detected  
Gamma-ray  
QPOs

Between the *whoop* and the *ding* of a binary NS merger, an HMNS can be formed. We looked for them and found two: GRB 910711 and GRB 931101B.

Future gravitational wave detectors (2030s) will be sensitive to these kHz frequencies too!  
In the meantime, we'll be looking for them with gamma rays.
